

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

¹ Death.

MORTALITY FROM TYPHOID FEVER: 1921.

The Department of Commerce, through the Bureau of the Census, announces that there were over 8,000 deaths from typhoid fever in 1921 in the registration area, which comprises 82 per cent of the total population of the United States. The death rate from this disease was 9 per 100,000 population in 1921 as compared with 7.8 in 1920.

Of the 34 States shown for 1921 and 1920, only 9 show lower rates in 1921 than in 1920, as follows:

State.	1921	1920	State.	1921	1920
California.....	4.3	4.8	New Hampshire.....	3.6	6.8
Connecticut.....	3.6	4.1	North Carolina.....	12.0	12.5
Maine.....	7.6	9.0	Vermont.....	5.4	10.5
Michigan.....	7.7	7.9	Washington.....	5.4	5.6
Montana.....	3.5	4.8			

In 1921 Rhode Island had the lowest adjusted rate (2.6 per 100,000 population), while South Carolina had the highest (26.5).

Of the 11 states showing rates by color, the lowest adjusted rate for the white population in 1921 was 3.6 and the lowest for the colored was 1.9, both for New York State, while the highest adjusted

rate for the white population was 24.8 for Kentucky and for the colored 40.7 for Tennessee.

For the 27 States contained in the registration area of 1917 the death rate from typhoid fever per 100,000 population was 13.5 in 1917, 12.6 in 1918, 9.2 in 1919, 7.8 in 1920, and 8.7 in 1921.

Deaths and death rates from typhoid and paratyphoid fever in the registration area (exclusive of Hawaii) and in the registration States.

¹ The adjusted rate makes allowance for the differences in the age and sex composition of the populations in different States by showing what the death rate would be if all States had the same proportion of males and females and the same proportion of the total population in each age group.

² The crude rate is based on total population and includes all deaths occurring within the given State.

³ Rate not calculated.

⁴ Including District of Columbia.

⁵ Not added to registration area until a later date.
